Art Unit: 2855

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that

form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United

States.

Claims 13, 14 and 16 are rejected under 35 U.S.C. 102(b) as being anticipated

by Ono et al.

Regarding claim 13, Ono et al teaches the aspects of the claimed invention, a

flexure capable of complying with the applied forces, comprising a first strip of material

(17), and a second strip of material (17(2)), wherein the first strip of material is adapted

to connect to the second strip of material to form the flexure element (fig. 8), and the

flexure element is connected to a first member (21) and a second member (14A) to

allow a relative displacement between the first member and the second member and

the first and second strip of material have a width that is at least twice its thickness (fig.

8)

Regarding claim 14. One et al teaches that the first and second strips of

material comprise substantially equal dimensions (fig. 8)

Regarding claim 16, Ono et al teaches the flexure comprises a plastic material

(col. 7, lines 23-25)

Claim Rejections - 35 USC § 103

Application/Control Number: 09/307,357 Page 3

Art Unit: 2855

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1, 2 and 4-12, 15, 17-19 and 27 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ono et al (5,555,004) in view of Armstrong (6,285,356).

Regarding claims 1, Ono et al teaches the aspects of the claimed invention, a force sensor measuring applied forces, comprising: a first member (21); a second member (4A), wherein the first member is positioned nearby to the second member (fig. 5); a flexure (17), the flexure connecting the first member and the second member (fig. 5), wherein the flexure supports the first member with respect to the second member and allows the first member to move relative to the second member substantially along two axes (col. 7, lines 50-59). Ono et al fails to teach a readout mechanism measuring the displacement of the first member relative to the second member substantially along each of the two axes, wherein the applied forces are determined from the displacement of the first member relative to the second member. Armstrong teaches a displacement joystick comprising sensors (42) for detecting direction and magnitude of force applied to tan arm (abstract). It would have been obvious to one skilled in the art at the time that the invention was made to have placed the sensors of Armstrong in the control device of Ono et al for the purpose of detecting the applied force in the joystick so that the amount of movement is known.

Application/Control Number: 09/307,357

Art Unit: 2855

Regarding claim 2, Ono et al teaches the first member comprises an inner member and the second member comprises an outer member (fig. 5)

Regarding claims 4, Ono et al fails to teach the readout mechanism comprising an inductive readout device. Armstrong teaches a displacement joystick with compression sensitive sensors, which are inductive (42). It would have been obvious to one skilled in the art at the time that the invention was made to have used the sensors of Armstrong in the device of Ono et al for the purpose of detecting direction and magnitude of force applied to an arm so that the amount of force is known to be applied to the arm.

Regarding claims 5 and 6, Ono et al teach a graspable handle (20), the graspable handle is integrally formed with the first member (21) and (fig. 5)

Regarding claim 7, Ono et al teaches a printed circuit board comprising the readout mechanism, the printed circuit board (12) positioned on one of the members (21) and reading the relative displacement of the two members

Regarding claim 8, Ono et al teach a plurality of strips of material of substantially equal dimensions, wherein the strips of materials (17, 17(2)) are adapted to connects to teach other to form the flexure (fig. 8)

Regarding claims 9 and 10, Ono et al fails to teach the strips of material have an aspect ratio of approximately 30:1 and are formed in an L-shape. Although Ono et al does not explicitly teach that the strips are L-shaped or the material have an aspect ratio of approximately 30:1, it would have been obvious to one skilled in the art at the time that the invention was made to have merely modified the shape of the component

Application/Control Number: 09/307,357

Art Unit: 2855

as well as discover the workable range which only involves routine skill in the art for the purpose of providing a material which when flexed will provide a measurement of the force on the material (M.P.E.P. 2144.04)

Regarding claim 11, Ono et al teaches the flexure comprises a plastic material (col. 7, lines 23-25)

Regarding claim 12, Ono et al fails to teach the flexure comprises a spring steel material. Armstrong teaches a spring (28) and (col. 7, lines 46-55). It would have been obvious to one skilled in the art at the time that the invention was made to have used the spring of Armstrong in the device of Ono et al for the purpose of supporting and restraining the arm when it is displaced.

Regarding claim 15. One et al fails to explicitly teach that the first and second strips of material are formed into L-shaped strips of material. However, One et al does teach the flexure strip (17). It would have been obvious to one skilled in the art at the time that the invention was made to have merely modified the shape of the component which only involves routine skill in the art for the purpose of providing a material which when flexed will provide a measurement of the force on the material. (M.P.E.P 2244.04)

Regarding claim 17, Ono et al fails to teach the flexure comprises a spring steel material. Armstrong teaches a spring (28) and (col. 7, lines 46-55). It would have been obvious to one skilled in the art at the time that the invention was made to have used the spring of Armstrong in the device of Ono et al for the purpose of supporting and restraining the arm when it is displaced.

Art Unit: 2855

Regarding claim 18, Ono fails to explicitly teach the dimensions of the strips of material determine the compliance of the flexure. Measuring the dimensions of the strip would give compliance of the flexure. It would have been obvious to one skilled in the art at the time that the invention was made to have taken the measurements of the strip for the purpose of providing an accurately fitting flexure

Regarding claim 19, Ono fails to teach the width of the first strip of material is approximately 30 times the thickness of the first strip of material material. It would have been obvious to one skilled in the art at the time that the invention was made to have to have modified the size of the strip material to 30 times the thickness of the material, since such a modification would have involved a mere change in the size of a component, for the purpose of fitting the strip material in the and around the first and second members (M.P.E.P. 2144.04)

Regarding claim 27, Ono teaches a first member comprising a handle (20)

Claim Rejections - 35 USC § 103

3. Claim 3 is rejected under 35 U.S.C. 103(a) as being unpatentable over Ono et al in view of Armstrong and further in view of Couch et al (6,033,309).

Regarding claim 3, Ono et al in view of Armstrong fails to teach the readout mechanism comprises an optical electronic device. Couch et al teaches a control pad wherein the LED's (24a) and the photodiodes (24b) detect motion in the joystick and generate an electric current directly in proportion to the amount of incident light (col. 5,

Application/Control Number: 09/307,357 Page 7

Art Unit: 2855

lines 9-12). It would have been obvious to one skilled in the art at the time that the invention was made to have used the LED's and photo-detectors of Couch et al in the control device of Ono et al for the purpose of illuminated the amount of tilt is being processed by the joystick (col. 5, lines 55-68)

Conclusion

4. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jewel V Thompson whose telephone number is 571-272-2189. The examiner can normally be reached on 7-4:30, off alternate Mondays.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Edward Lefkowitz can be reached on 571-272-2180. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
